

# **Spring 2009 Banding Summary**

## **Metro Beach Metropark**

**Allen Chartier  
Permit No. 23156**

### **INTRODUCTION**

The spring of 2009 was the sixth year of a renewed banding study to eventually be compared with the previous study conducted (in spring) from 1990-1999. Net lanes required little clearing this spring, and the same locations in use since last spring were used again (see the Spring 2008 report for net locations and names). A thistle sock feeder was placed inside the "U" of the Field Nets as was done last fall, and hummingbird feeders were placed near the Field Edge net with an empty decoy feeder on the opposite side on banding days, as has been done since 2005. Due to the heavy snow over the winter, some areas of vegetation were significantly broken down, reducing the undergrowth near the Willow Nets in particular. Water levels began lower than normal early in the season, but quickly returned to typical depths, and beyond, by late April.

Temperatures were near normal in April and cooler than normal in May. There was perhaps more rain in April than normal, which refilled the swamp, but very little in late May, which resulted in the banding area becoming much less muddy than is typical, as also happened last spring. Rain, thunderstorms, and wind hampered banding efforts on only a couple days in early May.

Deer were again in evidence in the banding area, and two nets were damaged; one of the Field Nets had to be replaced with a full height net in early April and the Field Edge net was damaged in late May. Another continuing problem is vandalism where our markers for net locations keep getting removed, and this year once again lots of logs and branches were placed in our walking paths in a manner that created more than an inconvenience, but a true injury hazard.

### **SPRING 2009 RESULTS**

Banding was conducted on 16 days between 5 April and 6 June, with nets open a total of 104.0 hours (1241.13 net hours). A total of 773 new birds of 60 species were banded, plus 226 recaptures (including 117 returnees from previous years) and 48 released unbanded, for a total of 1047 captures and a capture rate of 84.4 birds per 100 net hours. This is the second highest number of Net Hours since 2004 and also the second highest number of new birds banded, second highest total captures, and second highest capture rate. A comparison of all spring banding totals since 2004 is shown below in Table 1.

**Table 1. Comparison of annual spring banding effort, capture rates, and species diversity.**

Year	Days	Net Hrs.	No. Banded	No. Recaptures	Released unbanded	Total Captures	Capture Rate*	Species
'90-'99 Avg.	12	863.70	573	7	1	581	67.3	57
2004	16	666.00	575	55	49	679	102.0	66
2005	16	766.38	433	106	7	556	72.5	61
2006	20	1094.31	719	146	14	879	80.3	62
2007	17	1288.69	791	196	24	1011	78.5	65
2008	16	1315.25	657	256	31	944	71.8	60
2009	16	1241.13	773	226	48	1047	84.4	60

\*Capture rate is defined as number of individuals per 100 net hours.

The peak day was 23 May with 78 birds banded (plus 23 recaptures), and the most diverse day was 8 May with 27 species. A lack of coverage for 13 days during the peak of migration in mid-May likely affected the number of birds banded, including warblers and thrushes, among others.

Breaking down the captures by net groups, there were some interesting results as well as some expected results. On a per-net basis the Field Nets were the most productive, but only slightly more productive than the Field Edge and Swamp Nets. Reduced undergrowth near the Willow Nets may account for the lower capture rate there, while the Upland Nets were often exposed to windy conditions this spring which may account for the lower capture rate there (though the Field Nets were also often exposed to wind).

**Table 2. Captures by net groups.**

Net Group	No. captured	% captured	% per net
Field (2.5 nets)	185	23.9%	9.6%
Field Edge (1.0 net)	66	8.5%	8.5%
Willow (2.5 nets)	118	15.3%	6.1%
Upland (3.75 nets)	186	24.1%	6.4%
Swamp (3.5 nets)	218	28.2%	8.1%

Ruby-throated Hummingbirds were not concentrated around the Field Edge net where hummingbird feeders were placed from 1 May through 6 June, as only 2 out of 6 were captured there; 2 were captured in the Field Nets, and one each in the Upland and Willow nets. But the majority of Baltimore Orioles were captured in the Field Edge net (57.1%), obviously attracted by the feeders. Yellow Warblers were captured in a variety of locations with 54% in the Field, 25% in the Upland nets, 8% in the Swamp, 8% in Willow, and 3% in the Field Edge. Most American Goldfinches (80%) were captured in the Field. Last spring, a majority of male and female Red-winged Blackbirds were captured in different net groups. This year, with a much larger number captured (a record 166), things were different as 46% of females and 45% of males were captured in the Swamp Nets, 27% of females and 19% of males were captured in the Upland Nets, and 21% of females and 14% of males were captured in the Willow Nets. Surprisingly few individuals of either sex were captured in the Field Nets, which are adjacent to cattail marsh.

Among the highlights for this spring was the first Blue-headed Vireo in spring since 1996, only the second Eastern Kingbird ever banded here and the first since spring 1999, and only the third Savannah Sparrow ever banded at the site. Other highlights included four Northern Flickers, six Alder Flycatchers, three White-eyed Vireos, nine Veeries, 28 Hermit Thrushes, and record numbers for spring of Yellow Warblers (59), American Tree Sparrows (7), Red-winged Blackbirds (166), Common Grackles (24), Baltimore Orioles (14), and American Goldfinches (55). Thrush numbers improved slightly, especially Veery and Hermit Thrush, and the 12 Swainson's Thrushes was notably above the recent average, but is still below the 1990-1999 average. A Hermit Thrush on June 5 was very unusual while a Swainson's Thrush on June 6 was almost expected. Red-eyed Vireo went uncaptured for the sixth spring in a row. Warblers were sparse though banding was not conducted on 13 days at the peak of their migration. The 135 warblers of 15 species was about 20% less than last year's fairly low numbers. Sparrow migration was generally good, but White-throated Sparrows again were in low numbers while Fox and Swamp Sparrows had a good showing. Details for individual species can be found in Table 4 below.

Breeding evidence was found for the following species: 2 Ruby-throated Hummingbirds (females), 2 Hairy Woodpeckers (male and female), 6 Downy Woodpeckers (4 males, 2 females), 2 Northern Flickers (females), 1 Alder Flycatcher (female), 2 Willow Flycatchers (males), 3 Tree Swallows (males), 4 Black-capped Chickadees (2 males, 2 females), 1 Carolina Wren (female), 4 House Wrens (3 males, 1 female), 25 American Robins (18 males, 7 females), 5 Gray Catbirds (3 males, 2 females), 40 Yellow Warblers (31 males, 9 females), 6 Common

Yellowthroats (males), 17 Song Sparrows (14 males, 3 females), 6 Swamp Sparrows (5 males, 1 female), 1 Northern Cardinal (female), 83 Red-winged Blackbirds (16 males, 67 females), 18 Common Grackles (5 males, 13 females), 14 Baltimore Orioles (10 males, 4 females), and 1 House Sparrow (female). In general, this is less than was found in the area last year, except for Red-winged Blackbirds, Common Grackles, and Baltimore Orioles which were found in greater numbers. The number birds apparently using the banding area as part (or all) of their breeding territory is amazing. Details can be found in Table 5 below. It is clear that this patch of woodland and marsh is very important to breeding birds as well as migrants.

## **RECAPTURES**

The number of recaptures this spring was the second highest to date. These are summarized in Table 3 below. Birds banded at Metro Beach are very infrequently encountered any significant distance away from the park, so any reports of these “foreign” re-encounters are very special indeed. There are two such encounters to report. An American Goldfinch banded on 28 September 2008 as a HY-F was captured and released alive at a banding station on Walpole Island, Ontario, Canada (14.9 miles ENE of Metro Beach) on 6 June 2009. Also, the remains of a Northern Cardinal banded on 30 August 2008 as a HY-M were found “along the nature trails” within the park by a frequent visitor on 5 October 2008.

**Table 3. Recaptures by year.**

	Banded in 2008	Banded in 2007	Banded in 2006	Banded in 2005	Banded in 2004
2005 Recaps No. (species)	-	-	-	-	18 (8)
2006 Recaps No. (species)	-	-	-	53 (17)	9 (6)
2007 Recaps No. (species)	-	-	38 (12)	20 (8)	7 (5)
2008 Recaps No. (species)	-	61 (16)	14 (7)	25 (13)	6 (5)
2009 Recaps No. (species)	62 (14)	26 (9)	12 (8)	13 (8)	4 (4)

Details of these recaptures can be found in Tables 6-10.

## **WEIGHT GAINS/LOSSES**

One measure of the value of an area to migrant birds is the weight gain of those birds using the area. There is much variation from day to day, and year to year, with regard to how birds use an area, the condition they’re in when they arrive, and how long they’ll tend to use an area. In spring, birds are in more of a hurry to reach breeding grounds, so stopover durations are shorter, and fewer weight gains are noted. Table 11 below provides details of weight gains and losses detected during Spring 2009. There were more birds with weight losses than gains this spring, for the first time in recent years, though the average gain was still slightly greater than the average loss. One character of this area that supports migrant birds (though very few were recaptured this spring) is the hatch of midges, which typically occurs in mid-May at the peak of migration. This year, the midge hatch occurred in early June, so this abundant food source was not available to migrants. It should be noted that weight gains of female Yellow Warblers, Song Sparrows, Swamp Sparrows, and Red-winged Blackbirds which breed in the area, is probably associated with egg formation in those females, not fat deposition.

It is clear that this small, and rather isolated patch of habitat at Metro Beach Metropark continues to be an important stopover and refueling (feeding) site for migrating birds, and an important area for breeding birds as well.

Photo highlights of this spring's banding can be found at the end of this report.

## **ACKNOWLEDGMENTS**

I would like to thank the park superintendent, Jim Pershing, for giving us permission to band in the park, and drive our cars into a closed area. I would also like to thank the staff at the Metro Beach Nature Center for their continuing support, especially Julie Champion, Chris Becher, Nick Dicresce, and Michelle Serreyn.

Banding this spring simply could not have been done without the able assistance of the following volunteers: Elaine Attridge, John Bieganowski, Terri Chapdelaine, Andrea Charlebois, Chris Charlebois, Michael Charlebois, Nick Dicresce, David Furi, Chad Guerts, Neil Gilbert, Chris Goulart, Jean Gramlich, Gisela Lendle-King, Harry Lau, Rose Lau, Tessa Lau, Frank Lautner, Jennifer Philpot-Munson, Renee Render, Cathy Thiesen, Marilyn Thomas, Joan Tisdale.

**Table 4.** Birds banded at Metro Beach Metropark in Spring 2009, compared with the 1990-1999 average and the 2004-2008 average (No. per 100 net hours in parentheses). **Bold black text** indicates unusual species or high numbers. **Bold red text** indicates significant declines, or significant missing species from the tally.

## SPRING 2009 - PHOTO HIGHLIGHTS

Baltimore Orioles were banded in record numbers this spring.

This Savannah Sparrow was only the 3<sup>rd</sup> ever banded at Metro Beach.

“Molt limits” can be difficult to understand, and detect, in many bird species but they are an essential new (since 1997) way to determine the age of many species. Woodpeckers have a more complex molt sequence than most species. In this photo the white shaft on one feather, and barred and unbarred feathers clearly show the different-aged feathers on this Northern Flicker.

Hermit Thrushes are normally captured in April and early May, so this one on June 5 was quite unexpected.

This Eastern Kingbird was only the 2<sup>nd</sup> ever banded at Metro Beach, though it is a fairly common bird in the area.

As with most flycatchers, the Eastern Kingbird has a boisterous demeanor when captured.
